

ABSTRACT

A number of staple members 2 are connected separably by connecting means in a film-like shape at least from one face
5 side of the staple member 2 to constitute a connected staple.

The connecting means in the film-like shape is structured by a tearable film 10 comprising a porous film 11 comprising any of polymer films of polyester, nylon, or oriented polypropylene formed with through holes 12 or unpenetrated
10 holes having an average opening diameter of 0.5 through 100 μm by a density equal to or larger than 1000 holes/ cm^2 over an entire face thereof and a thermally melting polymer film 13 laminated on one face of the polymer film 11.
